

DirectoryManager for Cumulus

Automated Cataloging Processor

Automatically ingest, organize and add metadata to your digital assets

DirectoryManager™ works in two distinct modes:

• Directory Sync (DM Sync)

- Specify a directory and DirectoryManager will ingest all files in any subfolder of the directory.
 - DM can update any modified files within the specified directory.
 - DM can delete, rename or move records when it's corresponding record has been either deleted, renamed or moved.
- Specify a category and DirectoryManager will put newly cataloged or updated records in subcategories corresponding to subfolders.
 - To achieve extremely fast searches DM can only search folders with folder modification dates newer than the corresponding category's modification date.

• Central Asset Location Drop (DM Drop)

- Specify a directory and DirectoryManager will catalog the file and allow Cumulus to move it to the central asset location.
 - DM can update any modified files within the specified directory.
 - DM can delete, rename or move records when it's corresponding record has been either deleted, renamed or moved.

DirectoryManager System Requirements

DirectoryManager runs in the Canto Cumulus client-server environment. You must have a server running Cumulus 8.0 or 8.1. Client installations require:

- Apple Macintosh or Windows OS
- Access to a server running Canto Cumulus 8.0 or 8.1
