

Metadata is the most important element in any database. With Metadata Manager™, Cumulus® users have the ability to work with metadata interactively and dynamically.

Metadata Manager is an advanced pre-filler, record editor. With the ability to make custom plug-ins, it can harvest metadata from any existing source including XML output, office documents, or external databases.

- Specify record view sets and mandatory fields to insure that assets will not be ingested without the required metadata.
- Edit existing records—**Metadata Manager** will facilitate the population of metadata to existing records in the database using a full-featured metadata editor.
- Extensible auto-fill features—provide controls for automatically applying metadata while editing or pre-filling assets records through custom plug-ins.
- Use Excel documents to pre-store metadata—**Metadata Manager™** will apply metadata to records and ingest assets based on column values in Excel spreadsheets.
- Use custom editor plug-ins to render specific Cumulus fields in unique formats.
