

Manage your Workflow through one system

WorkflowManager for Cumulus is an extensible job routing solution based on Canto Cumulus. By combining different tasks, defined by plug-ins, WorkflowManager will orchestrate even the most complex multi user project. The state of each user's job, for each task in process, for every Workflow is stored in Canto Cumulus. It fully support the iPhone, iPod, and iPad for mobile users.

Tasks Include:

Approval Task

An extremely customizable approval cycle designed to meet any company's needs. It allows multiple voting methods, as well as the ability to download, or preview records. Approval comments are stored in the records, and the results are searchable.

Commission Task

A very useful way to work with freelancers or users not familiar with Cumulus. This task provides an inhouse or freelance artists with multiple assets which they can easily preview and download, with instructions on how to use or modify to complete the task. The freelancer can upload their completed files, and they will be stored in Cumulus, along with their notes.

Use Case

The true power of WorkflowManager is it's ability to string tasks together into a single process.

Here is a use-case that combines multiple approvals with multiple commissions: A manager sends out 10 commission tasks to freelance photographers with instructions to upload pictures of a hummingbird, and the deadline is set to a week. After a week, 6 photographers uploaded 40 pictures. When the week was up, the pictures are routed automatically to an approval task, sent to a group of 4 editors. The editors vote and pick their top five. The five approved photos get sent in a new commission task (along with the hummingbird article's text) to a page designer with instructions how to layout the photos on a page around the article. The designer completes his work and uploads the InDesign document. An approval task is created and sent back to the group of editors, but this time using a veto system. If any of the editor are unhappy, they comment on the document, and reject it. Until it is accepted by all four editors, it will go back in a new commission task to the page designer, and then back to the editors for approval. When the article is finally approved, it can be automatically sent to the person assembling the magazine.

Manage your Workflow with ease!

Automatically track, organize and manage projects in Canto Cumulus.

Workflow Engine

WorkflowManager is powered by the Moksa Workflow engine. It processes the logic for, and routing of, each task and function in the Workflow process. All project information is tracked and stored in Cumulus.

WorkflowManager Requirements

WorkflowManager runs in the Canto Cumulus client-server environment.

Client installations require:

- Apple Macintosh running Mac OS X 10.4 or later
- Windows XP or higher
- Canto Cumulus 8.0 or higher
- Supports any modern web browser
